

Homework 01: Working with Images

Kaveh Fathian, Email: fathian@ariarobotics.com

Handout: 2025-09-08

Due: 2025-09-15, 11:59pm, on Canvas

General Instructions:

- You should solve the homework and submit your report **individually**. Identical submissions will receive a grade of zero.
- Getting help from others or checking your answers with other students (not the TAs) is okay and encouraged.
- Ask any questions on **Ed Discussion** (instead of emailing).
- **Before** the homework due date, TAs are strictly prohibited from **pre-grading** your homework. Do not expect the TAs to help you verify if your answers are correct or give you the problem solution.
- **After** the homework due date, if you do not know how to solve a problem, reach out to the TAs. They will walk you through the solution and help you understand it. Note that homework solutions will **not** be posted because some problems will be used in next year's class.
- **Exams** may contain questions related to homework, so make sure you learn how to solve the homework problems correctly.
- The deliverables are outlined for each problem, and you should carefully **follow the instructions**. Failing to follow instructions will result in **points being subtracted**.
- You will submit a **single PDF** file to Canvas as your homework report. The PDF must contain your **answers** and any requested **outputs** (e.g., printouts, snapshots of code, or GUIs). If requested, follow the instructions specified by the problem to provide your **code** (e.g., in a compressed .zip or .tar file) in addition to the PDF file.
- **Grading:** Each homework in this class will contribute **5pts** to your final grade (there will be 12 homework assignments, each 5pts, leading to 60pts for all assignments). A detailed grading **rubric** will be posted on **Canvas** after the homework due date. Any bonus points will be added to your overall course bonus points, which will be added to your final grade.
- **Late submission:** Late or missed submission will not be accepted and will receive a grade a zero. Any excused absence must be documented and disclosed to the instructor (extensions will be granted on a case-by-case basis). Three or more missed homework lead to an INC grade.

Homework 01: Working with Images

Due: 2025-09-15, 11:59pm, on Canvas

EXERCISE 1 (5pts) – The objective of this homework is to learn more about image filtering. Do **NOT** use generative AI to solve this homework; otherwise, you will not learn to code!

Steps:

- Load an image of **yourself** (e.g., the one used in HW01). Convert it to grayscale and appropriate type (e.g., float32) if needed.
- Apply the following 3x3 filters **without** using an existing implementation by implementing the filtering equation yourself. You need to implement the filter yourself using `for` loops. If you use existing filtering implementations in Python libraries (such as `correlate` and `convolve` filters), you will not get any points.

$$f_1 = \begin{bmatrix} 1 & 2 & 1 \\ 0 & 0 & 0 \\ -1 & -2 & -1 \end{bmatrix}, \quad f_2 = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 0 \end{bmatrix} - \frac{1}{9} \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}, \quad f_3 = \frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix}$$

Hint: consider downsampling your image for speedup. Having 50 to 100 pixels in each dimension should be sufficient.

- Display the filtered image. You may need to adjust the pixel values/ranges (e.g., if they are negative) and select a colormap so that the output image looks correct.
- Explain what each filter does. If the filter has a name, mention it.

Deliverables:

- Snapshot of your entire code, e.g.:
Snapshot of your input (grayscale) image
- Snapshots of your filtered images for filters f_1 , f_2 , and f_3
- Explanation of what each filter does and its name (if discussed in class)

```
110 def expand(self, gr: Graph) -> Graph:
111     graph_result = gr
112     level = gr.num_of_levels
113
114     if level <= 0:
115         raise ValueError("Input Graph should not be empty")
116
117     # Compute A1
118     action_list = []
119     for action in self._planning_problem.actions:
120         if self._applicable(action, graph_result.prop[level - 1],
121                             graph_result.prop_mutexes[level - 1]):
122             action_list.append(action)
123
124     for proposition in graph_result.prop[level - 1]:
125         action_list.append(NoOpAction(proposition))
126     graph_result.act[level] = action_list
